Q: Custom response for django rest api generic views I am trying to create a rest api using django rest framework. I have created a view as below. class ApiView(generics.ListAPIView): queryset = Endpoint.objects.all() serializer_class = EndpointSerializer permission_classes = [permissions.IsAuthenticated,] def get_queryset(self): return self.queryset.filter(viewable=True) Api serializer: class EndpointSerializer(serializers.ModelSerializer): class Meta: model = Endpoint fields = ('id', 'name', 'description', 'credentials', 'access_granted') def create(self, validated_data): return Endpoint.objects.create(**validated_data) When I call the get_queryset method, it is throwing error as below. ValueError: The query did not return a list of items. Also, I wanted to use a generic API view, so created one like below. class EndpointResource(generics.ListAPIView): Now, when I am calling the get_queryset method, it is giving me error as below. ValueError: The view EndpointResource.get_queryset does not have the name get_queryset. I am following the documentation, which are not very much helpful. Can anyone help me with this. A: You are overriding queryset. So change the name of get_queryset. Q: use included file in aspx.cs file I have many buttons in aspx page that change color when click. I want to use one class file that have those methods and make them use in different buttons. For example I have a class that use events. protected void button1_Click 82157476af
